What is built, and where to find it

This guide explains the Link 1 design handoff: what it covers, what you received, and how to find your way around it. It takes about five minutes to read.

What is built

Link 1 is the creator's first journey on Credalio, from sign-up to a first validation. Every screen is designed for desktop and mobile, including empty, error, in-review and success states.

Onboarding → First dashboard → Start creating → Readiness: identity · credentials · policies → Creator Orientation (7 modules) → Collaboration & declarations → Validation Centre

151 screens (302 boards, desktop + mobile). Phase 2 (wallet, earnings, discussions, calendar, analytics, help, course studio) is not part of this handoff.

What you received

1

Clickable prototype

The design canvas link. Every screen side by side, desktop and mobile, in flow order.

Use it to: see the flow, click through it, inspect any screen.

2

Developer package (zip)

The code of every screen, all images, the fonts, design tokens, a screen index and a README.

Use it to: build. Exact values live here.

3

Screen book (PDF)

Every screen on its own page, desktop and mobile, in flow order, with a contents page.

Use it to: review, plan tickets, discuss with the team.

4

Screenshots (zip)

Every board as an image, numbered in flow order.

Use it to: attach to tickets and specs.

NAVIGATE

Finding your way around

1 · The prototype (canvas)

- **Page 1** holds every screen in flow order, grouped under section labels. Each row is a desktop board (1440 wide) next to its mobile board (390 wide).
- **Press Play** to click through the flow. Animations (route line, confetti, typing) only run in Play mode.
- **Page 2** holds shared sources. These are not screens; boards on page 1 reuse them with a state (for example a check that is unanswered, right or wrong).

2 · The developer package

index.html	Every screen in flow order with desktop and mobile links. Start here.
screens/	The code: one responsive `.dc.html` file per screen, plus the small runtime that renders it.
tokens/	Colours, type, radii, shadows, sizes, breakpoints and motion as CSS variables and JSON.
assets/ · fonts/	Every image used, and Google Sans.
screens.csv	Each screen's file, its state, and which screens it links to.
README.md	The detailed reference: patterns, rules, breakpoints.

To open it: unzip, then run `python3 -m http.server 8000` inside the folder and open `localhost:8000`. Opening files directly with `file://` does not work (browsers block the scripts).

3 · Screen names

`CR-AREA-NUMBER`, for example `CR-KYC-003`. Areas: ONB onboarding, DASH dashboard, RDY readiness, KYC identity, CRED credentials, POL policies, ORI orientation, CTR Creator Centre, CREATE start creating, NOT notifications, HOME home pages, COL collaboration, ASG assigned to me, DEC declarations, VAL validation. A trailing letter is a state, such as `e` error or `d` done.

BUILD

Five things to know before you build

- **One file per screen, not per device.** Each screen is responsive. The mobile board only previews the same file at 390 wide.
- **States are variants, not copies.** A board like `CR-KYC-004` just shows `CR-KYC-003` in its “verified” state. Build one component with a state prop.
- **Values come from the code.** Treat the files as a precise reference for colour, size, spacing, radius, shadow and motion, and rebuild them in your own components. The tokens folder has the shared values.
- **Build these patterns once:** the onboarding frame, the dashboard shell (sidebar + top bar), the focus/task shell, the orientation lesson player, the outcome page (success, in review, action needed, failed), the info tooltip and the field error.
- **Responsive rules:** breakpoints at 1080, 960 and 760. Onboarding never scrolls on a laptop (1440×820, 1280×720). Touch targets are at least 44px. All motion turns off with “reduce motion”.

Good to know

Links	Buttons that link to another screen work in the prototype. Buttons leading to phase 2 screens are intentionally not linked yet.
Sample data	Names, amounts and dates are examples. Copilot name, Creio balance, readiness, orientation progress and attempts left are dynamic.
Creio vs Credits	Creio (AI usage) is always gold. Credits (wallet) are always cobalt.
Role picker	All four roles are selectable. In phase 1 only Creator and Organization continue.
Font	Google Sans, from Google Fonts. Please confirm its licence before shipping; Google Sans Flex or Inter are the closest alternatives.
